

NAME

xenstored - xVM store daemon

SYNOPSIS

/usr/lib/xenstored

DESCRIPTION

The xenstored daemon provides control of the configuration of Solaris xVM domains.

Service Management Facility Support

The xenstored service is managed by the service management facility, smf(5), under the service identifier:

svc:/system/xvm/store:default

The service's status can be queried using the svcs(1) command.

The service can be enabled successfully only when running under xVM.

At this time, attempts to restart the daemon can cause the failure of xVM management tools as well as running domains. If the daemon needs to be restarted, a reboot is necessary.

FILES

/var/run/xenstored/tdb Configuration database.

ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxvmu
Interface Stability	Volatile
